## 1.7 Duality and properties

duality of point  $(a, b)$  is  $y = ax - b$  and duality of line  $y = ax + b$  is  $(a, -b)$   
Properties:

1.  $p$  is on  $l$  iff  $l^*$  is in  $p^*$
2.  $p$  is in intersection of  $l_1$  and  $l_2$  iff  $l_1^*$  and  $l_2^*$  lie on  $p^*$
3. Duality preserve vertical distance
4. Translating a line in primal to moving vertically in dual
5. Rotating a line in primal to moving a point along a non-vertical line
6.  $l_i \cap l_j$  is a vertex of lower envelope  $\iff (l_i^*, l_j^*)$  is an edge of upper hull in dual

## 2.9 Ear decomposition

- 1- Find a spanning tree of the given graph and choose a root for the tree.
- 2- Determine, for each edge  $uv$  that is not part of the tree, the distance between the root and the lowest common ancestor of  $u$  and  $v$ .
- 3- For each edge  $uv$  that is part of the tree, find the corresponding "master edge", a non-tree edge  $wx$  such that the cycle formed by adding  $wx$  to the tree passes through  $uv$  and such that, among such edges,  $w$  and  $x$  have a lowest common ancestor that is as close to the root as possible (with ties broken by edge identifiers).
- 4- Form an ear for each non-tree edge, consisting of it and the tree edges for which it is the master, and order the ears by their master edges' distance from the root (with the same tie-breaking rule).

### 3.11 Combinatorics

**Useful formulas**

$\binom{n}{k} = \frac{n!}{k!(n-k)!}$  — number of ways to choose  $k$  objects out of  $n$

$\binom{n+k-1}{k-1}$  — number of ways to choose  $k$  objects out of  $n$  with repetitions

$\left[ \begin{smallmatrix} n \\ m \end{smallmatrix} \right]$  — Stirling numbers of the first kind; number of permutations of  $n$  elements with  $k$  cycles

$$\left[ \begin{smallmatrix} n+1 \\ m \end{smallmatrix} \right] = n \left[ \begin{smallmatrix} n \\ m \end{smallmatrix} \right] + \left[ \begin{smallmatrix} n \\ m-1 \end{smallmatrix} \right]$$

$$(x)_n = x(x-1) \cdots x-n+1 = \sum_{k=0}^n (-1)^{n-k} \left[ \begin{smallmatrix} n \\ k \end{smallmatrix} \right] x^k$$

$\left\{ \begin{smallmatrix} n \\ m \end{smallmatrix} \right\}$  — Stirling numbers of the second kind; number of partitions of set  $1, \dots, n$  into  $k$  disjoint subsets.

$$\left\{ \begin{smallmatrix} n+1 \\ m \end{smallmatrix} \right\} = k \left\{ \begin{smallmatrix} n \\ k \end{smallmatrix} \right\} + \left\{ \begin{smallmatrix} n \\ k-1 \end{smallmatrix} \right\}$$

$$\sum_{k=0}^n \left\{ \begin{smallmatrix} n \\ k \end{smallmatrix} \right\} (x)_k = x^n$$

$$C_n = \frac{1}{n+1} \binom{2n}{n} \text{ — Catalan numbers}$$

$$C(x) = \frac{1-\sqrt{1-4x}}{2x}$$

**Binomial transform**

If  $a_n = \sum_{k=0}^n \binom{n}{k} b_k$ , then  $b_n = \sum_{k=0}^n (-1)^{n-k} \binom{n}{k} a_k$

- $a = (1, x, x^2, \dots)$ ,  $b = (1, (x+1), (x+1)^2, \dots)$
- $a_i = i^k$ ,  $b_i = \left\{ \begin{smallmatrix} n \\ i \end{smallmatrix} \right\} i!$

**Burnside's lemma**

Let  $G$  be a group of *action* on set  $X$  (Ex.: cyclic shifts of array, rotations and symmetries of  $n \times n$  matrix, ...)

Call two objects  $x$  and  $y$  *equivalent* if there is an action  $f$  that transforms  $x$  to  $y$ :  $f(x) = y$ .

The number of equivalence classes then can be calculated as follows:  $C = \frac{1}{|G|} \sum_{f \in G} |X^f|$ , where  $X^f$  is the set of *fixed points* of  $f$ :  $X^f = \{x | f(x) = x\}$

**Generating functions**

Ordinary generating function (o.g.f.) for sequence

$$a_0, a_1, \dots, a_n, \dots \text{ is } A(x) = \sum_{n=0}^{\infty} a_n x^n$$

Exponential generating function (e.g.f.) for

$$\text{sequence } a_0, a_1, \dots, a_n, \dots \text{ is } A(x) = \sum_{n=0}^{\infty} a_n x^n$$

$$B(x) = A'(x), b_{n-1} = n \cdot a_n$$

$$c_n = \sum_{k=0}^n a_k b_{n-k} \text{ (o.g.f. convolution)}$$

$$c_n = \sum_{k=0}^n \binom{n}{k} a_k b_{n-k} \text{ (e.g.f. convolution, compute with FFT using } \widetilde{a_n} = \frac{a_n}{n!} \text{)}$$

**General linear recurrences**

If  $a_n = \sum_{k=1}^n b_k a_{n-k}$ , then  $A(x) = \frac{a_0}{1-B(x)}$ . We also can compute all  $a_n$  with Divide-and-Conquer algorithm in  $O(n \log^2 n)$ .

**Inverse polynomial modulo  $x^l$** 

Given  $A(x)$ , find  $B(x)$  such that  $A(x)B(x) = 1 + x^l \cdot Q(x)$  for some  $Q(x)$

1. Start with  $B_0(x) = \frac{1}{a_0}$

2. Double the length of

$$B_{k+1}(x) = (-B_k(x)^2 A(x) + 2B_k(x)) \bmod x^{2^{k+1}}$$

**Fast subset convolution**

Given array  $a_i$  of size  $2^k$ , calculate  $b_i = \sum_{j \& i = i} b_j$

```
for b = 0..k-1
  for i = 0..2^k-1
    if (i & (1 << b)) != 0:
      a[i + (1 << b)] += a[i]
```

**Hadamard transform**

Treat array  $a$  of size  $2^k$  as  $k$ -dimensional array of size  $2 \times 2 \times \dots \times 2$ , calculate FFT of that array:

```
for b = 0..k-1
  for i = 0..2^k-1
    if (i & (1 << b)) != 0:
      u = a[i], v = a[i + (1 << b)]
      a[i] = u + v
      a[i + (1 << b)] = u - v
```

## 4 String

### 4.1 Manacher

```
int m[MAXN]; // SET MAXIMUM LENGTH OF STRING
void build(string s)
{
    int n = s.size();
    int l = 0, r = 0;
    for (int i = 0; i < n; i++)
        if (r <= i)
        {
            l = i, r = i + 1;
            while (2 * l - r >= 0 && s[r] == s[2 * l - r])
                r++;
            m[i] = r - l;
        }
        else if (m[2 * l - i] < r - i)
            m[i] = m[2 * l - i];
        else
        {
            l = i;
            while (2 * l - r >= 0 && s[r] == s[2 * l - r])
                r++;
            m[i] = r - l;
        }
}
```

### 4.2 Palindromic tree

```
struct PalindromicTree
{
    struct node
    {
        int to[SIGMA]; // SET MAXIMUM NUMBER OF CHARACTERS IN ALPHABET
        int link, len;
        node()
        {
            for (int i = 0; i < SIGMA; i++)
                to[i] = -1;
            link = len = 0;
        }
    } tree[MAXN]; // SET MAXIMUM LENGTH OF STRING
    int sz, suf;
    string s;
    void clear()
    {
        sz = 0;
        tree[sz++] = node();
        tree[sz++] = node();
        tree[0].len = -1;
        suf = 1;
        s = "";
    }
}
```

```
bool add_letter(int c)
{
    int pos = s.size();
    s += char(c);
    while (pos - tree[suf].len - 1 < 0 || s[pos] != s[pos - tree[suf].len - 1])
        suf = tree[suf].link;
    if (tree[suf].to[c] != -1)
    {
        suf = tree[suf].to[c];
        return false;
    }
    tree[sz] = node();
    tree[sz].len = tree[suf].len + 2;
    tree[suf].to[c] = sz++;
    int cur = suf;
    suf = sz - 1;
    if (tree[suf].len == 1)
    {
        tree[suf].link = 1;
        return true;
    }
    do
    {
        cur = tree[cur].link;
    } while (pos - tree[cur].len - 1 < 0 || s[pos] != s[pos - tree[cur].len - 1]);
    tree[suf].link = tree[cur].to[c];
    return true;
}

PalindromicTree()
{
    clear();
}

};
```

### 4.3 Z function

```
int z[MAXN]; // SET MAXIMUM LENGTH OF STRING
void build(string s)
{
    int n = s.size();
    z[0] = n;
    int l = 0, r = 0;
    for (int i = 1; i < n; i++)
        if (r < i)
        {
            l = r = i;
            while (r < n && s[r - l] == s[r])
                r++;
            z[i] = r - l;
        }
        else if (z[i - l] < r - i)
            z[i] = z[i - l];
        else
        {
            l = i;
            while (r < n && s[r - l] == s[r])
                r++;
            z[i] = r - l;
        }
}
```

```

    }
}

```

## 5 Data structure

### 5.1 Treap

```

#include <iostream>
#include <vector>
#include <algorithm>

using namespace std;

typedef pair<int, int> pii;

struct Treap {
    typedef pii T;
    typedef struct _Node {
        T x;
        int y, cnt;
        _Node *l, *r;

        _Node(T _x) {
            x = _x;
            y = ((rand() & ((1 << 16) - 1)) << 16) ^ rand();
            l = r = NULL;
            cnt = 1;
        }
        ~_Node() { delete l; delete r; }
        void recalc() {
            cnt = 0;
            if (l)
                cnt += l->cnt;
            cnt++;
            if (r)
                cnt += r->cnt;
        }
        void debug() {
            if (l)
                l->debug();
            if (r)
                r->debug();
            cerr << x.first << " " << x.second << " " << (
                l ? l->x.first : -1) << " " << (r ? r->x.
                first : -1) << " " << cnt << endl;
        }
    } _Node;
};

```

```

} *Node;

Node merge(Node l, Node r) {
